

## Énergir – Lockout Tool

*Notable Nominee –  
Worker Safety Leadership Award*

- A device for padlocking electrical cables that are screwed onto terminal blocks of control panels that power equipment in installations (solenoid, transmitter, lighting, etc.) which helps to protect employees from electric shock
- As employees had no means of locking out this type of action on the equipment, cable would be disconnected and left floating in the panel – anyone could walk by and plug the cable back in
- This locking device will ensure that the cable cannot be connected to the terminal block that needs to be disconnected, thus avoiding putting at risk the employee who is working on the equipment
